

A research study about

Gastrointestinal microbes in children with Autism

The aim of this study is to examine gastrointestinal microbes (such as bacteria and viruses) in children with autism. The results will assist in understanding the gastrointestinal problems (such as constipation and diarrhoea) experienced by many children with autism.

Participants required:

- Children with Autism (Autistic Disorder)
and
- Typically developing siblings of children with Autism

All children need to be aged between 2-12 years to be included.

What's involved:

- Collect and send a faecal (poo) sample twice (with a two month interval between samples) and complete a short questionnaire.

You will be supplied with all necessary materials for collection, storage and postage.

Parents will receive \$50 for each participating child.

Please help us with this important research.
